

Indoor Air Quality Monitor

The AppliedSensor iAQ-2000 Indoor Air Quality Module is a sensitive, electronic component that monitors unhealthy airborne VOCs that may be sourced from smoke, odors and gases released from food preparation, from human metabolism, from cleaning supplies, or from building materials. The component is designed to integrate with HVAC systems in locations such as hotels, schools, offices, gyms, and other commercial facilities. Once installed, the unit automatically activates air handling systems to increase ventilation as needed to refresh the air. A smaller model – the iAQ-100 – is designed for use in smaller spaces.
